

Abstract of the Disclosure

A valve device is detachably attached to a functional component disposed at an upper inside portion of a fuel tank. An attaching device is fixed to the functional component for attaching the valve device inside the fuel tank. The valve device includes a connecting pipe portion and is disposed at the upper inside portion of the fuel tank so that the outside and the inside of the fuel tank are communicated through the connecting pipe portion. The valve device is closed when a fuel level increases.
